The Story Schema:

Universal and Culture-Specific Properties

The first section of this chapter outlines a theory of

stories that deals with some important properties of the genre of

popular stories in Western literature. The second section of the

paper describes a recent series of experiments suggesting that

this structural-affect theory of stories accounts for a number of

aspects of the story schema in English-speaking readers. The

next two sections provide an analytic framework that can be used

to examine the conventionalized aspects of stories and then

applies this framework to cross-cultural work on oral literature.

The final section presents some hypotheses about the nature of

the universal and culture-specific aspects of stories from the

oral tradition and contrast these features with those of written

stories from Western popular literature.

A Theory of Stories

The basic theory of stories sketched here has been presented

in Brewer and Lichtenstein (1981, 1982, submitted). This theory

relates particular text structures to particular affective states

and then relates the affective states to story intuitions and

overall judgements of liking. The goal of the theory is to give

an account of the story schema of literate English-speaking

adults.

The Narrative Component

In the narrative component of the theory we distinguish

between event structure and discourse structure. The event

structure that underlies a narrative consists of a series of

events arranged in temporal order with respect to some real or

imaginary world. The events are structured through the use of

plan schemas and causal schemas (Schank & Abelson, 1977;

Schmidt, Sridharan & Goodson, 1978). These schemas that underlie

narratives are presumably the same ones that are used to

structure the observed actions of objects and people in the

ordinary world (cf., Brewer & Dupree, 1983; van Dijk, 1975;

Lichtenstein & Brewer, 1980).

Discourse structure refers to the sequential arrangement of

events in the narrative. For a given event sequence there will

be many possible discourse sequences. The term discourse is

meant to be modality free: the discourse order of a written

narrative is the particular arrangement of the events in the

text, the discourse order of an oral narrative is the particular

arrangement of the events in the spoken presentation, and the

discourse order of a motion picture is the particular arrangement

of the events in the film.

The distinction between event and discourse is a traditional

one in structuralist theories of literature. The Russian

Formalists were very clear on this issue and referred to the two

levels as the "fabula" and the "sjuzet" (cf. Chatman, 1978, for
a review).

The author of a narrative has enormous freedom to omit or
rearrange events in the discourse. A theory of the reader's
narrative schema should give an account of the psychological
processes that the reader uses to go from the presented discourse
organization to the underlying event organization (see Brewer,
1980, 1982). Thus, for example, it would give an account of the
effects on comprehension of flashbacks in a text. There is as
yet no detailed account of the narrative schema for English
(however, see Johnson & Mandler, 1980, for a start).

The Affective Component

The affective component attempts to capture the fact that
stories are intended to entertain and that they carry out this
function by evoking affects such as suspense and surprise. As
part of a general theory of aesthetics, Berlyne (1971) has
attempted to relate several general patterns of emotional
response to pleasure and enjoyment. In particular, Berlyne has
postulated that enjoyment is produced by moderate increases in
arousal ("arousal boost") or by a temporary sharp rise in general
arousal followed by arousal reduction ("arousal jag"). If both
processes operate together, then pleasure is produced both by the
rise in arousal and by the subsequent drop in arousal ("arousal-
boost-jag"). The affective component of the story theory

attempts to apply this more general hedonic theory to the domain
of stories.

The Structural-Affect Component

The structural-affect component of the theory relates
particular discourse structures to particular affective states
produced in the reader. This component of the theory has been
greatly influenced by contemporary structural approaches to
literary theory (Barthes, 1974; Chatman, 1978; Culler, 1975; &
Sternberg, 1978).

In several recent papers (Brewer & Lichtenstein, 1981,
1982, submitted), we have proposed three major discourse
structures (surprise, suspense, curiosity) which we claim
underlie the structure of a large proportion of popular stories
from Western culture. Each of these discourse structures is
based on a different arrangement of the discourse with respect to
the underlying event structure, each is designed to produce a
particular affect.

Surprise. An event structure capable of producing surprise
must contain critical expository or event information early in
the event sequence. This information is critical in the sense
that it is necessary for the correct interpretation of the event
sequence. In a surprise discourse structure, the author
withholds this critical information from the beginning of the
discourse structure without letting the reader know that
something has been withheld. Then, at the end of the discourse,

the author reveals the information, and the reader is surprised.
The surprise is resolved when the reader successfully
reinterprets the event sequence in light of the unexpected
critical information. An example of a minimal surprise discourse
structure is: "Marian walked into her bedroom. She opened her
closet door to reach for her nightgown and saw a hand holding a
knife." In the underlying even sequence, the person with the
knife entered the closet before Marian walked into her bedroom.
However, the author has deliberately withheld this critical
information from the discourse in order to produce surprise in
the reader.

Suspense. An event structure capable of producing suspense
must contain an initiating event or situation. An initiating
event is an event that could lead to significant consequences
(either good or bad) for one of the characters in the narrative.
The event structure must also contain the outcome of the
initiating event. In a suspense discourse structure the
discourse is organized with the initiating event early in the
discourse. The initiating event causes the reader to become
concerned about the potential outcome (see Jose & Brewer, in
press). Then the discourse typically contains some additional
material in order to prolong the suspense; and finally the
outcome is given, resolving the suspense for the reader. Thus,
in a simple suspense discourse structure, the order of events in
the discourse maps the order of events in the event structure.

An example of a minimal suspense discourse structure based
on the above event sequence is: "The psychopath hid himself in
the closet. Marian slowly climbed the stairs to her bedroom.
Marian walked into her bedroom. She opened her closet door to
reach for her nightgown and saw a hand holding a knife. She
slammed the closet door and escaped out the front door." Note
that it is the reader's affect which is crucial. In this example
the character is presumably feeling little or no affect while
walking up the stairs, yet the reader is in suspense. If the
author chooses to reveal the initiating information to both the
character and the reader, then both the character and the reader
will experience some form of affect.

Curiosity. An event structure capable of producing
curiosity must include a significant event early in the sequence.
In a curiosity discourse structure the author withholds the
significant event from the discourse, but (unlike the surprise
discourse structure) provides enough information about the
earlier event to let the reader know that the information is
missing. This discourse structure leads the reader to become
curious about the withheld information. The curiosity is
resolved by providing enough information in the later parts of
the discourse for the reader to reconstruct the omitted
significant event. The classic mystery story is a good example
of the curiosity discourse structure. The discourse typically
opens with the discovery of the crime, and the rest of the

discourse provides information designed to allow the reader to reconstruct the significant events that occurred just before the opening of the discourse (i.e., how the crime was committed and who the criminal was). Figure 1 illustrates the three event-structure/discourse-structure relationships and gives the predicted effect curve for each.

Insert Figure 1 about here.

The Enjoyment Component

We have focused on the discourse organization component of an overall theory of narrative appreciation. In particular we have extended the work of Berlyne (1971) and have hypothesized that readers will enjoy narratives organized to produce surprise and resolution, suspense and resolution, or curiosity and resolution (Brewer & Lichtenstein, 1981, 1982, submitted). Thus, readers will prefer narratives with discourse structures that produce surprise to narratives with the same event structures, but not organized to produce surprise, and they will prefer narratives with suspense discourse structures that produce and resolve suspense to those that produce suspense but do not resolve it.

The Story Intuition Component

We have recently (Brewer & Lichtenstein, 1981, 1982, submitted; Lichtenstein & Brewer, submitted) claimed that the

three discourse structures from the structural-affect component form the major part of the concept "story" for literate adult speakers of English. Thus narratives with an initiating event and an outcome (suspense discourse structure) will be called stories, whereas narratives without an initiating event or without an outcome will not be called stories. Narratives with a critical event and resolution (surprise discourse structure) will be called stories, while narratives without a critical event or with no resolution will not be called stories; and similarly narratives with a significant event and resolution (curiosity discourse structure) will be called stories, while narratives without one or the other will not.

We argue that story intuitions (unlike judgements or liking) are not based on the actual affect produced by the narrative. Clearly one can know that a particular text is a story without liking the text or directly feeling a particular pattern of affect. Instead, we have proposed that story intuitions are mediated by two possible mechanisms: knowledge of story discourse structures and meta-affect. The structural hypothesis suggests that story intuitions are based on the reader's knowledge of the canonical discourse structures for stories. The meta-affect hypothesis suggests that the story intuitions are based on the reader's meta-knowledge about the affective responses which the events in the narrative are capable of producing.

In summary, the structural-affect theory of stories relates particular discourse structures to particular affective states and then relates both of these components to story intuitions and story enjoyment.

Empirical Results Relating to the Story Theory

Event Structure

The hypothesis that goal-directed events are interpreted in terms of plan schemas was strongly supported by the experiments reported in Lichtenstein and Brewer (1980). In that study we had subjects view video-tapes of goal-directed events (such as an actor setting up a slide projector) and then had subjects recall what they had seen. We developed a theory of the psychological representation of goal-directed events in terms of plan schemas and then tested the theory with the recall data. The data clearly support the hypothesis that observed goal-directed actions are interpreted in terms of plan schemas. Events that were higher in the goal hierarchy were recalled better than events lower in the hierarchy; actions in canonical schema order were recalled better than actions not in canonical order, and actions presented in noncanonical order tended to shift in recall to their canonical positions.

Narrative Structure

The hypothesis that event structures underlie narratives was also examined in the study by Lichtenstein and Brewer (1980). In order to relate our findings with observed events to linguistic

narrative structures, we wrote out narratives which described the videotaped events. We then carried out recall studies with these narratives and obtained basically the same results that we had obtained with the recall of the videotaped events. Hence we argued that both observed goal-directed events and written narratives are understood and recalled by means of the same plan schemas.

Since our findings for the recall of natural goal-directed events and for narratives were essentially the same as those in the story-recall literature deriving from the story grammar tradition (Mandler, 1978; Mandler & Johnson, 1977; Rumelhart, 1977; Stein & Nezworsky, 1978; Thorndyke, 1977), we argued that these studies are best interpreted as studies of memory for goal-directed events and studies of narrative structure, and not as studies of the structure of stories. Thus, for example, the finding that actions higher in the goal hierarchy are better recalled than actions lower in the hierarchy (Rumelhart, 1977; Thorndyke, 1977) is probably due to nonlinguistic plan schemas operating in recall. However, those studies which manipulated the order of events in the discourse with respect to the order of events in the event structure (Mandler, 1978; Stein & Nezworsky, 1978; Thorndyke, 1977) can be looked at as investigations of narrative structure, with the general finding that narratives are generally easier to understand and remember if the discourse order maps the event order. A more detailed discussion of the

reinterpretation of story grammars and plan-based theories of

stories can be found in Lichtenstein and Brewer (submitted) and

Brewer (1982).

Structure and Affect

Data from two recent studies (Brewer & Lichtenstein, 1981,

submitted) examined the relationship between discourse structures

and affective states. In these studies we asked subjects to

start reading a narrative, and then we stopped them at fixed

points in the narrative and asked them to make judgements about

their affect (e.g., degree of suspense, surprise, curiosity).

The results were in strong agreement with the structural-affect

component of the story theory. Narratives without an initiating

event showed little suspense. Narratives with suspense discourse

organization showed a strong rise in suspense and a drop at the

point of resolution. Narratives with surprise discourse

organization showed a strong rise on the surprise scale at the

point where the critical information was introduced into the

discourse. Narratives with curiosity discourse organization

structures showed a rise in curiosity when information about the

significant event was introduced and a sharp drop in curiosity

when the significant event was revealed in the discourse

structure. See Figure 2 for an example of the suspense and

surprise curves for one narrative from Brewer and Lichtenstein

(1981).

Insert Figure 2 about here.

Story Intuitions

Data from the two studies just outlined (Brewer &

Lichtenstein, 1981; submitted) also supported the story

intuition component of our theory. In addition to asking the

subjects to make affect ratings, we also asked them to rate the

narratives on the degree to which they were stories or

nonstories. The data were in good agreement with the theory

outlined earlier. Narratives without an initiating event or

without an outcome were not considered to be stories. However

narratives with suspense discourse structures, surprise discourse

structures or curiosity discourse structures were all considered

to be stories.

Thus, the findings from a variety of studies suggest that

the structural-affect theory of stories is capable of handling a

wide range of data concerning event structure, discourse

structure, affective curves, and story intuitions. However, this

theory was designed to deal with written stories from Western

culture and has been tested with readers from the same culture.

The next section of the paper will explore the implications the

theory has for the cross-cultural study of stories.

Cross-Cultural Nature of the Story Schema: Empirical Findings

There have been two recent empirical studies directed at the issue of the universality of the story schema, and they arrive at opposite conclusions. Kintsch and Greene (1978) conclude that story schemas are culture specific, while Mandler, Scribner, Cole and DeForest (1980) conclude that there is a universal story schema.

Kintsch and Green investigated the issue by having Colorado undergraduates write summaries of four Western short stories (from the Decameron) and four native Alaskan narratives. They found that the undergraduates could write better summaries of the Western short stories than they could of the Alaskan narratives. In a second experiment Colorado undergraduates were asked to carry out recall of a Western fairy story and an Apache story. Recall was better for the fairy story. Since Kintsch and Greene used only members of one culture for this study, it is an incomplete experimental design. Without data from Alaskan and Apache subjects showing the reverse pattern of results one cannot know if the findings were due to a mismatch between the subjects' story schema and the texts or if the particular nonEnglish tests chosen were simply intrinsincally harder to recall for individuals from any culture. Nevertheless, Kintsch and Greene conclude that the data show that story schemas are culture specific.

Mandler, Scribner, Cole and DeForest (1980) studied the issue by having American children and adults and Liberian children and adults listen to and recall four Western folktales and one Liberian folktale. They found that the amount and pattern of recall for the two groups were quite similar. They suggest, on the basis of these findings, that the structure of folktales may be a cultural universal.

The basic problem with these empirical studies is that they are based on theories of stories that do not distinguish between event structure, narrative structure, and story structure. The results of a cross-cultural study using stories are not analytic unless the study is designed to distinguish between these three types of information. If one carries out a cross cultural study using stories as stimuli and finds a difference between culture X and culture Y, then one does not know if the two cultures differed at the level of event and plan schemas, at the level of narrative schemas, or at the level of story schemas.

The next section of the paper attempts to use the analytic framework, developed for studying stories in Western culture, to examine the issue of the cultural specificity or universality of the story schema. This approach has the advantage of bringing a theory to bear on the problem, but the disadvantage of letting a laboratory scientist loose in the complex world of cross-cultural anthropology.

The Story Schema: Culture Specific Properties

Events

Clearly the members of a particular culture have knowledge
of a wide variety of culture-specific goal-directed actions,
e.g., hosting a potlatch ceremony, operating a Xerox machine,
sending a drum message. Knowledge of this type is one very
important aspect of an individual's culture, but it must be
carefully distinguished from narrative and story schemas.
Consider the following thought experiment: An American college
undergraduate and a member of the Txikaos tribe from the Amazon
Basin watch two different goal-directed actions: (a) someone
setting up a slide projector and (b) someone preparing materials
for a complex Txikaos religious ceremony. If we then ask the two
individuals to explain the two actions to us or to recall the two
action sequences, we would almost certainly get enormous culture-
specific differences. Each individual would be attempting to
apply plan schemas to both actions, but would not be successful
for the cross-culture actions, since they would not be able to
fully understand the particular goals and intentions of the
actors in the cross-culture episode. If we described the two
action sequences in narrative form and carried out a recall study
we would expect similar culture-specific results, yet this
difference would be due to the culture-specific nature of the
underlying goal-directed actions and would tell us nothing about
the cultural specificity of narrative or story schemas.

In fact, Steffensen and Colker (1982) have recently carried
out a version of this design with narrative materials. They
asked Australian Aboriginal women and women from the United
States to recall two narratives: one narrative described a child
becoming sick and being treated by Western medical practices, and
the other described a child becoming sick and being treated by
Aboriginal native medicine. They obtained the expected culture-
specific results, with each group showing much better recall for
the same-culture narrative than for the cross-culture narrative.
Each group was using culture-specific knowledge about the
intentions and goals of the actors to interpret the action
sequences described in the narratives.

Narratives

Culture-specific aspects of narrative are characteristics of
narratives that hold for all narratives of a culture (both story
and nonstory) or for a class of nonstory narratives.

Labov (1972) has given an example that might fit this
criterion. Labov had middle-class white speakers and inner-city
black speakers each tell about an event that happened to them.
In analyzing these narratives Labov noted one important
difference in narrative form. He found that middle-class white
narrators tended to use "external evaluation." They interrupted
the narrative and made explicit comments about their feelings or
emphasized the point they were trying to make. The inner-city
black narrators tended to us "internal evaluation." They did not

interrupt the narrative, but got information across by using
exact quotations or by describing an external action that would
act as a sign of an internal state. This distinction is similar
to the distinction between "telling" and "showing" in written
narratives (cf., Booth, 1961, Ch. 1). Labov's data thus suggests
that there are cultural differences in narratives of personal
experience with respect to how the narrator chooses to convey
certain types of information to the listener.

Tannen (1980) has compared narratives told by Greek speakers
and English speakers describing a short film. She reports a
variety of culture-specific narrative choices by the two groups,
e.g., the Greek narrators tended to include more specific
judgements about the actions of the characters. Thus, it seems
likely that additional cross-cultural work will show a variety of
culture-specific characteristics in the narrative schema.

Stories: Oral

In this section an attempt is made to identify the culture-
specific characteristics of stories that are true reflections of
story structure and not merely reflections of culture-specific
event structure or narrative structure. First we will examine
stories from oral literature.

The oral literature of nonliterate cultures typically
includes a wide variety of genres--folktales, myths, legends,
proverbs, riddles (Bascom, 1965; Ben-Amos, 1981; Brunvand, 1968;
Finnegan, 1970). Essentially all cultures have one or more

narrative genres designed primarily to entertain (Bascom, 1965,
p. 4; Brunvand, 1968, p. 103; Finnegan, 1967, p. 60; Degh,
1972, p. 60; Smith, 1940, p. 64). For the purposes of the
cross-cultural analysis we will focus on the broad class of
"stories," where the term is taken to include all long narratives
designed primarily for entertainment (see Brewer & Lichtenstein,
1982, pp. 477-478).

The purpose of this analysis of stories from oral literature
is to uncover the aspects of these narratives that are specific
to stories. Thus, we must look for culture-specific story
conventions. A story convention is revealed by the differential
occurrence of some feature in stories when compared to ordinary
spoken language or to other specialized genres. In Table 1 we
attempt to provide an overall framework for the study of story
conventions. Along the left side of the table are the basic
story elements: opening, setting, characters, events,
resolution, epilogue, closing and narrator. Along the top of the
table are the basic discourse options: (a) The discourse can
include a particular story element or omit it. (b) The element
can be made explicit in the discourse or can be included in some
more indirect fashion. (c) For a given story element the type
can vary. (d) The point in the discourse when an element is
first introduced can vary. (e) An element can be repeated or not
in the discourse. (f) For events, the discourse order can be the
same as the underlying event order or it can vary.

Insert Table 1 about here.

Reflecting the basic story elements across the basic
discourse options produces, to a first approximation, an
inventory of possible story conventions. In the rest of this
section oral literature from a diverse set of cultures is
examined in order to see what different types of story
conventions have been observed and thus what the characteristics
of culture-specific story schemas are. We will examine the issue
for each narrative element in turn (i.e., row by row).

Openings. Conventionalized story openings occur widely
throughout the world (Finnegan, 1970, p. 379-380; Jacobs, 1964,
p. 334). Some of these openings use conventionalized setting
information such as the "He lived there" of the Clackamas Indians
of the American Northwest or "Once upon a time" from the Western
oral tradition (Thompson, 1977, p. 457). Others are so formulaic
that they have no other meaning; for example, the Zuni story
opening is said to be untranslatable (Tedlock, 1972, p. 123).

Setting. In order to show that setting information is story
specific it is necessary to show that its occurrence in stories
differs from its occurrence in nonstory narratives. Jacobs gives
some good examples from American Indian cultures. He states that
in some of these oral literatures there was a small set of
obligatory forms of location and/or time from which the setting

must be selected. Thus for a particular culture the setting
might have to include "he left the village" (1964, p. 335). The
Kham of Nepal actually have an explicit verb form that
distinguishes setting information from event information, though
it is not clear if this story specific (Watters, 1978). It
appears that many North American Indian cultures omitted
descriptive setting information relating to nature (Jacobs, 1964,
p. 336; Shimkin, 1947, p. 341). Dégh notes that European
folktales have a conventionalized setting in the Middle Ages
(1972, p. 64).

Characters. There are clear differences in conventionalized
characters across cultures. Thus the protagonist of trickster
stories is a coyote among North American Indians (Thompson, 1977,
p. 319), a rabbit among cultures in Central Africa, and a spider
in West Africa (Finnegan, 1970, p. 337). A number of authors
have suggested that little detail describing characters is given
in stories from the oral tradition: the Limba of West Africa
(Finnegan, 1967, p. 52); the Zuni of the American Southwest
(Tedlock, 1972, p. 130). There are a variety of conventional
ways of introducing the characters of stories. The Longuda of
Nigeria (Newman, 1978, p. 103) and the Khaling of Nepal (Toba,
1978, p. 158) both require that all the characters be introduced
at the beginning of the story. The Hanga of Ghana conventionally
introduce the villian before the hero (Hunt, 1978, p. 241), while
among the Sherpa of Nepal the order of character introduction is

victim, villain, hero (Schöttelndreyer, 1978, p. 253). A very
common characteristic of oral literature is the repetition of
character types (e.g., three brothers, three monsters). The
number of repetitions varies from culture to culture. It is five
for the Clackamas of the Pacific Northwest (Jacobs, 1959, p.
224); it is four for Navaho (Toelken, 1981, p. 167), it is three
for stories in the Western oral tradition, e.g., "The Three
Bears" (Olrik, 1909/1965). The order of introduction for a set
of repeated characters is often conventional. A very common
pattern is for the conventionalized number of brothers to be
introduced (and carry out their actions) in order from oldest to
youngest, with the youngest finally successful. This pattern
occurs in the Navaho (Toelken, 1981, p. 167), the Nez Percé
(Stross, 1972, p. 110) the Clackamas (Jacobs, 1959, p. 227) and
the Western oral tradition (Olrik, 1909/1965, p. 136).

Events. In order to show that some aspect of the story
events are conventionalized one must show that they differ in
some way from the events actually occurring in the culture.
Thus, the fact that seal hunting occurs in Eskimo stories more
often than it does in Apache stories says nothing about
conventionalized story events. Nevertheless there is much
obvious evidence for conventionalized events. Most cultures have
story characters who carry out superhuman acts--killing monsters,
moving huge objects, visiting the heavens. A number of writers
have noted that the events selected for inclusion in a story are

chosen for their dramatic or entertainment value (Finnegan, 1967,
p. 60; Fischer, 1963, p. 237; Shimkin, 1947, p. 332; Smith,
1940, p. 67). Frequently there are conventionalized event
sequences known as motifs (see, Thompson, 1977). Thus Zulu
stories disposed of villains by giving them a bag of snakes and
scorpions to open (Finnegan, 1970, p. 381). Many American Indian
groups used a motif in which the hero ascended to the sky by a
ladder made of arrows (Jacobs, 1964, p. 337). In stories from
Western oral tradition there is the motif of rescuing the
princess from the dragon or the motif of danger from wishes that
come true (Thompson, 1977, p. 24, 134).

Examination of the ordering of events in oral literature
shows much repetition and parallel development. Thus, the
protagonist will carry out one act, then a second similar act;
or the protagonist can repeat exactly the same act. If there are
several characters with similar roles, one attempts to carry out
an act (and often fails), then the second character attempts the
same act, and so on. For discussions of these issues see Dégh
(1972, p. 61), Finnegan (1967, p. 89), Fischer (1963, p. 249-
252), Olrik (1909/1965, p. 132-134), Shimkin (1947, p. 340), and
Stross (1972, p. 109-112). A number of investigators have stated
that in stories from oral literature the discourse order always
follows the event order (Finnegan, 1967, p. 49; Fischer, 1963,
p. 249; Jacobs, 1959, p. 213; Olrik, 1909/1965, p. 137);
however, other investigators have reported the occurrence of

flashforwards and flashbacks in stories from oral traditions,
e.g., the Shoshone (Shimkin, 1947, p. 339) and the Toura of West
Africa (Bearth, 1978, p. 215). It is not clear if these
discourse/event order conventions are story conventions or
general narrative conventions.

Resolution. Fischer (1963, p. 237) has stated that all
stories in oral literature have a "dramatic" structure (i.e.,
Brewer & Lichtenstein's suspense discourse structure) and that
they include some form of resolution of the conflict. However,
there are some counterexamples. For example the Limba have a
subgenre of "dilemma" stories in which conflict is created and
deliberately not resolved (Finnegan, 1967, p. 30). It is not
clear if there are conventions about stories resolving with
"good" outcomes. Certainly a number of stories from oral
literature have "bad" endings from the point of view of a Western
reader.

Epilogue. In many oral literatures stories contain a
conventionalized epilogue that makes a meta-comment on the story,
gives a summary, or gives some post-resolution information about
the characters. For example Clackamas stories had an obligatory
explanatory segment (Jacobs, 1959, p. 247). Limba stories could
have a moral, a generalizing comment, or an explanatory segment
(Finnegan, 1967, p. 88). Shoshone stories could have an
explanatory segment or additional information about the
characters (Shimkin, 1947, p. 334). Hanga stories gave either a

summary, or a moral, or both (Hunt, 1978, p. 240). Some Sherpa
stories include a moral and then a summary of the events from the
story that are relevant to the moral (Schöttelndreyer, 1978, p.
265).

Closing. Conventionalized closings occur very widely. They
vary from the simple "it is finished" of the Limba (Finnegan,
1967, p. 87) and "they lived happily ever after" of Western oral
literature (Thompson, 1977, p. 457) to the enigmatic Shoshone
"Coyote way out there is tracking through slush" (Shimkin, 1947,
p. 335). In one type of closing for stories of the Fali of West
Africa the linguistic form is not formulaic, but, instead a
conventionalized event must be described--several dogs of
different colors going hunting, killing game, and eating it
(Ennulat, 1978, p. 148). However, my personal favorite is the
conventionalized closing used by the Kamba of East Africa "May
you become rich in vermin in your provision-shed, but I in cows
in my cattle-kraal" (Finnegan, 1970, p. 380).

Narrator. In an oral tradition the individual actually
telling the story is obviously the narrator. But the issue is
actually somewhat more complex than that. The individual telling
the story can be merely a vehicle or can intrude into the
narrative and provide information and make evaluative comments.
It is not completely clear from the few accounts that discuss the
issue if there are story specific narrator conventions, but it
seems likely. Dégh (1972, p. 61) states that in telling European

folktales there were conventionalized forms of narrator
intrusion. The Khaling of Nepal have a number of linguistic
devices (e.g., locative adverbs) that must be used when the
narrator interrupts the sequence of events in the narrative
(Toba, 1978, p. 160). Limba narrators have a word form which
they use to indicate that they are about to give the audience
information which is not yet known to the characters (Finnegan,
1967, p. 76). The Syuwa of Nepal show an interesting relation of
narrator to narrative. The Syuwa language has a sentence final
particle which indicates whether the speaker witnessed the
information or that it is unverified second-hand information. In
telling stories Syuwa narrators use the unverified marker for the
initial sentence but then can shift to the speaker witnessed form
for the rest of the story (Höhlig, 1978, p. 23-24).

Vocabulary and syntax. In addition to the conventionalized
story elements discussed above there are frequently
conventionalized vocabulary, morphology, and syntax (see:
Jacobs, 1964, p. 332; Tedlock, 1972; Toelken, 1981). However,
these more linguistic aspects of stories in oral literature will
not be covered in this paper.

The purpose of this analysis of stories in oral literature
was to gain some understanding about the nature of culture-
specific story schemas. The framework provided by Table 1 and
the cross cultural evidence outlined above give a good indication

of the types of information about content and form that are
represented in culture-specific story schemas.

Stories: Written

In this section we will attempt to uncover some of the types
of information that are part of the story schema for Western
written stories. In keeping with the analysis of stories from
the oral tradition we will focus on long narratives designed
primarily for entertainment--spy novels, mystery novels,
westerns, science fiction, and popular short stories. We will
not examine "literary" genres in this paper. In fact, it seems
unlikely that most members of Western culture have been exposed
to enough examples of literary texts to have developed a schema
for these genres.

Openings. One very obvious difference between written
stories and oral stories is that written stories do not have a
conventionalized opening. Even the most formulaic genres do not
have a fixed linguistic form that must appear at the beginning of
the story.

Setting. The placement of setting information in written
stories has apparently undergone a change since the late 1800's.
In earlier novels (e.g., Fielding, Scott, Trollope) it was
conventional to place much setting information at the beginning
of the discourse (Sternberg, 1978). However, in more recent
fiction it has become conventional to omit the initial setting
and distribute the information throughout the discourse. In

fact, O'Faolain (1963) has argued that the convention of opening
a discourse with an event (e.g., "She saw him put it in his
pocket.") is one of the most striking characteristics of modern
fiction. The type of setting used is also often
conventionalized. Thus, classic mystery stories are
conventionally set in the English countryside. In popular
literature the American West of the late 1800's has become a
conventionalized setting, while New England mill towns of the
same period have not.

Characters. The number and order of introduction of
characters does not appear to be a frequently conventionalized
aspect of written stories. However, the types of characters are
highly conventionalized. In order to show that a character type
has become conventionalized it is necessary to show that
individuals of that type portrayed in stories can be
distinguished from the society's general stereotypes of that type
of individual. Thus detectives with extraordinary powers of
reasoning are almost certainly conventionalized characters in
Western written stories, since our cultural stereotype of real
world detectives does not include such extraordinary powers of
reasoning. Which types of individuals are chosen for inclusion
is also conventionalized—note the names of several specific
Western genres: detective stories, spy stories, cowboy stories.
In principle one could have a genre in which a tree is discovered
to be dead, the arborist is called, and through extraordinary

powers of reasoning the arborist discovers what caused the tree
to die, but in practice, the detective has become a
conventionalized character and the arborist has not.

Events. Many writers have noted that a basic characteristic
of the events in written stories is that they are selected to
provide conflict (Brooks & Warren, 1979, p. 36; Jaffee & Scott,
1960, p. 2-3; Perrine, 1970, p. 43). The order of events in the
discourse of written stories often does not map the order of the
underlying events. Both O'Faolain (1963) and Sternberg (1978)
suggest that presenting events in the discourse out of their
underlying order is an important convention of modern fiction.
It is these event related aspects of written stories that form
the core of Brewer and Lichtenstein's structural-affect theory of
stories.

Western written stories also show conventionalized motifs:
first contact with an alien species in science fiction, the
Russian scientist who wishes to defect in the spy novel, the gun
duel on Main Street in the Western.

Resolution. A number of writers have noted that the
underlying structure of most written stories is a build up of
tension that is resolved near the end of the discourse (Brooks &
Warren, 1979, p. 36; Altenbernd & Lewis, 1969, p. 23). Perrine
(1970, p. 44-48) notes that "inexperienced" readers have trouble
appreciating modern literary works that do not resolve. There
have been, in recent years, some shifts in the conventions about

outcome valence of stories (e.g., a good or bad ending). Up
through the 1950's a good outcome was conventionalized for many
written genres, e.g., spy stories, western, adventure stories.
However, in the last few decades this story convention has become
less rigid and stories with bad endings sometimes occur in these
genres (Cawelti, 1976, p. 42). Perrine (1970, p. 47) comments
that the frequent use of bad outcomes in modern literature is
another factor which causes inexperienced readers to have
problems appreciating these works. Thus, it appears that in
modern entertainment fiction the "happy ending" has shifted from
a rigid story convention to a somewhat weakened convention.

Epilogue. The explicit use of summaries or morals is not a
convention of popular written stories, though there is some use
of epilogues to give additional information about the course of
events after the resolution of the basic conflict.

Closing. Apparently, modern written stories do not show an
obligatory closing form. A quick sample of 20 recent paperback
books (5 science fiction, 5 mystery, 5 spy, 5 best sellers) from
our shelves at home showed no use of the formulaic closing "The
End."

Narrator. The intrusiveness of the narrator in written
stories is another convention that has shifted in written
stories. During the 1800's an intrusive narrator was the
conventional form. However, by the turn of the century the
convention shifted and the use of unintrusive narrators became

conventional (O'Faolain, 1963, p. 52; Scholes & Kellogg, 1966,
p. 268). Perhaps one of the most elaborate set of conventions in
written stories are those related to point of view. Written
stories have evolved a variety of techniques that involve the
information available to the narrator, the location of the
narrator, and the visibility of the narrator (Booth, 1961;
Friedman, 1955).

Story schema. In comparing the Western written story to the
oral story it appears that the written story shows less
conventionalization with respect to number of story elements and
the fixed location of story elements, but does have much
conventionalized content (i.e., types of setting, characters,
events, and resolutions). In written stories discourse
organization tends to replace repetition as a device for
producing affect.

The Story Schema: Universal Properties

In this section we will explore the issue of story
universals. Clearly this is a speculative business. The logic
of uncovering culture-specific aspects of stories is much
clearer. One finds two cultures with different story conventions
and contrasts them. The logic of uncovering story universals is
much less certain. One examines the similarities across cultures
and makes the inductive leap. Nevertheless the attempt must be
made if we are to have a comprehensive theory of stories.

As with the analysis of culture-specific universals, we will distinguish phenomena occurring at the level of events, at the level of narrative, and at the level of stories.

Events

While many contents of goal-directed actions will be culture-specific the underlying use of plan schemas to understand human actions must be a universal. I find it hard to imagine a human culture in which individuals do not interpret human actions in intentional form.

Narrative

It seems clear that members of all cultures will need to be able to describe action sequences in linguistic form, so narrative will be a universal form of discourse. In narratives designed primarily for comprehension, the order of events in the discourse will map the order of the underlying events, and some setting information will be placed at the beginning of the discourse. Both of these conventions should reduce the cognitive load for the narrative understander and are derived from more general restrictions on human beings as information processors.

Stories: Oral

In this section we will look for universals in oral literature that are separate from the event universals and narrative universals. First, it appears that all cultures have a genre of long prose narratives told primarily for entertainment (Boas, 1925, p. 329; Bascom, 1965, p. 16; Fischer, 1963, p.

237, 241). It seems likely that the entertainment is produced by the activation of affective states such as suspense surprise, curiosity, humor, sexual arousal, anger, and irony. However the universal status of these particular affective states in oral stories clearly needs investigation. Similarly the status of the particular devices used in stories to produce affect need to be studied cross-culturally (see Finnegan, 1967, p. 61).

The use of conventionalized openings and closings seems to be a universal (see Dégh, 1972, p. 60-61; Finnegan, 1970, p. 379-380; Jacobs, 1964, p. 334; Olrik, 1909/1965, p. 131-132). Certain types of characters may occur in all cultures. Thus, talking animals may be universal characters (Boas, 1925, p. 333) and the hero figure may also be universal (Fischer, 1963, p. 255). It may be that characters in the oral tradition show limited characterization (Finnegan, 1967, p. 52; Tedlock, 1972, p. 130) or that the characterization is done by "showing" not by "telling" (Olrik, 1909/1965, p. 137). Another possible universal is that characterization is carried out in terms of extremes (e.g., extremely strong, or beautiful, or evil). The repetition of characters may be a universal feature of stories in the oral tradition (Jacobs, 1964, p. 334; Olrik, 1909/1965, p. 133).

The choice of events to produce particular affective states may be a universal (Fischer, 1963, p. 237), and the repetition of events in stories seems to be universal (Boas, 1925, p. 330;

Dégh, 1972, p. 61; Fischer, 1963, p. 251; Olrik, 1909/1965, p.

132-133).

Oral Literature vs. Written Literature

In this section we will compare the universals postulated to

occur in stories in the oral tradition with the features found in

stories from the Western written tradition and attempt to give

accounts of the differences.

One major difference between written and oral literatures is

genre specialization. Many oral narratives appear to be carrying

out a wide variety of functions all at the same time. Thus, a

single oral narrative may be doing what West written literature

would do through a novel, a religious text, a history text, a

scientific journal article, a dirty joke, and a philosophical

essay (see Finnegan, 1967, p. 31, 63; Fischer, 1963, p. 258).

Literacy, the printing press, and specialization of function in

Western society have allowed the development of very specialized

genres. Along with the specialization of discourse force (e.g.,

to inform, or to entertain, or to persuade) has gone

specialization of discourse form (cf. Brewer, 1980). Thus,

written texts include specialized forms such as the "pyramid

style" of the newspaper article, the formulaic heading of the

scientific journal article, and the inverted order of the mystery

story.

The occurrence of conventionalized openings and closings in

stories from the oral tradition may reflect the difference

between having a live narrator versus an "abstract" narrator in a

written story. The teller of an oral story has to distinguish

narratives told for entertainment from the teller's everyday

discourse, and the conventionalized openings and closings may

serve this function. This hypothesis is supported by Davenport's

gloss for the story opening used in the Marshall Islands, "this

is a fairy tale; it may or may not have happened long ago; it

is not to be taken seriously; it is not always supposed to be

logical" (1953, p. 224). It is also supported by the Rattray's

translation of the opening of Ashanti stories, "We do not really

mean, we do not really mean (that what we are going to say is

true)" (1969, p. 55). In written stories this type of

information is given by the book cover, by the knowledge of where

the book was obtained, and by other indicators of genre.

The differences in characterization between oral and written

stories may also be due to the fact that stories in the oral

tradition are performed, not read. In decontextualized written

stories the character information has to be placed in the

discourse, but in oral stories the performer can act out the

characters' emotions and internal states, so that such

information need not be placed explicitly in the discourse (see,

Finnegan, 1967, p. 52; Fischer, 1963, p. 237).

Finally the occurrence of repetition at a number of levels

in oral stories may be a story device that is particularly

successful at producing suspense in an oral performance

(Davenport, 1953, p. 226; Finnegan, 1967, p. 79; Jacobs, 1959,

p. 224; Olrik, 1909/1965, p. 133; Toelken, 1981, p. 167); or

it may help the narrator's fluency (Jacobs, 1964, p. 335); or

serve to reduce the memory load for both the performer and the

audience (Finnegan, 1977, Ch. 3).

Overall, these differences between oral and written stories

can be seen as similar to the distinction Chafe (1982, in press)

makes between integration and involvement in language. The

decontextualized nature of written stories leads to a need for

complex characterization and point of view development. The use

of the written mode makes possible the elaboration of these

devices and also allows complex rearrangements of the discourse

order (flashbacks and flashforwards).

In contrast, the performed nature of oral stories leads to

the need for conventionalized opening and closing and to the use

of repetition to overcome memory limitations. The ability of the

performer to dramatize some aspects of the information reduces

the need to place this information explicitly in the discourse.

Conclusions

The purpose of this chapter has been to uncover basic

properties of the story schema. An analytic framework has been

proposed that distinguishes between event schemas, narrative

schemas, and story schemas. This approach provides considerable

clarification of the difficult issues in this area. Applying the

framework to oral literatures from a variety of cultures provides

an initial account of the nature of universal and culture-

specific story schemas. Culture-specific story schemas for

stories from the oral tradition tend to include a wide variety of

conventions about the occurrence and discourse order of story

elements such as: openings, characters, events, epilogues, and

closings. Story schema universals reflect more abstract

characteristics of stories, such as the use of affect to produce

enjoyment and the use of repetition and parallel structure.

By contrasting the findings for oral literature with those

for Western written genres it is possible to highlight the story

conventions of Western written stories. The story schema for

written stories tends to include fewer conventions about the

number and fixed discourse order or story elements. However,

like the story schema for oral stories, it does appear to include

a number of conventions about the type of settings, characters,

and events that are included in stories. The written story

schema tends to use discourse organization instead of repetition

ot produce affect (cf. Brewer & Lichtenstein, 1981, 1982,

submitted). The story schema for written stories tends to show

explicit character description, and elaborate development of

narrator point of view. Finally, it is possible to account for

some of the differences between the story schema for oral and

written stories by taking into account the fact that oral stories

are performed by narrators, while written stories are experienced

in a decontextualized setting.

May you become rich in vermin in your provision-shed, but I

in cows in my cattle-kraal.
