marks, scattered passim, on copyright and electronic publishing.

For the academic librarian, the strength of Graham's essays lies in the insight they offer into the rationales and practices that govern management of the publishing business. He approaches these subjects with a mixture of frankness, informality, and sagacity that pushes the reader in interesting directions. Still, As I Was Saying fails to lead beyond observations miscellaneously presented, and Graham neglects to link his ideas with arguments capable of clarifying and deepening our understanding of the dynamics of contemporary publishing.—Henry Lowood, Stanford University, Stanford, California.

Despite the promise of the title, this volume is concerned with a broad treatment of the essential scientific aspects of information science rather than its practice per se. In their preface the authors call it "an attempt to present and discuss a scientific understanding of the processes of information transfer . . . [as] a human, social activity, . . ." As such, it covers a wide range of topics in information science, but in the context of established research and not contemporary practice. Its ten chapters deal with three broad categories: information transfer in the wider societal context, information and the individual, and the nature of information systems. Rather than integrating disparate studies from fields such as anthropology, psychology, and computer science, the authors focus on more applied aspects of these fields in the formal study of information. This book can rightly claim to be a "core" text on information science as a distinct discipline, not an integration of information science with these disciplines.

Specifically, the authors address the nature of information from the fundamental exchange of information at the microbial level (including an amusingly disgressive discussion of the reproduction of a bacteriophage that illustrates communication in nature) to the nature of language, logic, basic forms of information, and the personal semantic experience of information retrieval. This presentation is quickly incorporated into the context of the information system, with the text as the fundamental type of information considered and traditional publication and libraries as the primary sites of dissemination. Some topics, such as the implications of linguistics, necessarily are dealt with superficially to allow larger themes to emerge. While the authors discuss electronic interfaces, systems, and databases, it is in the context of a much broader understanding of human information processing and systems.

The Vickerys artfully integrate the results of hundreds of studies into this broad sketch, providing the reader with both concise summaries of the core research in various areas as well as pointers for further reference and study. At the same time, the omission of the context of practice and of an integration of contemporary issues that are rapidly changing the nature of the field may limit the value of this otherwise excellent book. To a degree, the authors acknowledge this problem, but the work suffers nevertheless from its failure to incorporate the human experiences of recent innovations in technology and their implications for both theory and practice. They tend to rely on older examples of particular technologies, such as MYCIN, an expert system of the 1970s, rather than the many online, CD-ROM, and network-based resources that are now much more familiar.

This book is expertly written with a long-term perspective, encapsulating well-established research dating from the emergence of the modern discipline of information science in the postwar era to some developments up through the mid-80s. The erudition and experience of the Vickerys are manifest in both the selection of their topics and the formal, polished style with which they are presented. The book skillfully combines the subject areas of traditional library science
(such as file and record organization, the reference interview, and information systems databases) with the scientific study of information retrieval models drawn from other contexts.—Matthew Wall, Drexel University, Philadelphia, Pennsylvania.

SHORT NOTICES

A recent exhibition of manuscripts and early printed books from the collections of the Italian state libraries ("the places of written memory" alluded to in the title) documents their role in creating and preserving a cultural heritage. In three sections, each supported by explanatory essays, the catalog focuses on the works of early monastic libraries ("I Libri del Silenzio"); the collections of manuscripts and printed volumes of the great Renaissance libraries, such as the Medicea Laurenziana of Florence and Modena's Estense ("I Libri del Decoro"); and treasures from the libraries of Italy's cardinals ("I Libri del Porporo"). Lengthy entries for each manuscript or book exhibited give its provenance, historical significance, and place within a particular collection. Bibliographic notes lead the reader to secondary sources. A helpful index of the manuscripts in the exhibition, arranged by current library location and collection, gives some sense of the riches of each of the major state libraries represented here. The catalog is well designed and beautifully illustrated. (JB)

This booklet, the sixth in the "Collection Management and Development Guides" series, is based on Paul Mosher and Marcia Pankake's guidelines published in the October/December 1983 issue of Library Resources and Technical Services. In outline format and very sparse prose it sketches the basics of cooperation: the benefits, the "challenges," (the kinder, gentler '90s term for the "problems" of the 1983 edition), types of cooperatives, varieties of cooperative activities, planning and implementing the agreement, assessing and strengthening resources, and providing bibliographic and physical access. A directory of cooperatives, a glossary, and an extensive bibliography complete this carefully prepared publication. (SL)

Specialized journals of this kind are all but irresistible to their particular target markets, which is not to say that the need isn't real enough. This new journal was conceived to redress the perceived marginalization of college libraries and their concerns in the professional literature. It emphasizes the practical and day-to-day, with a corresponding de-emphasis on what we call "research" and "theory." Articles in the first issue cover topics such as "holistic" librarianship, summers off, citation analysis of freshman papers, a bar-coding project, textbooks in the collection, food in the library, library-skill workbooks (plus ça change . . . ), accessing the Internet. Some, but not all of these offer a uniquely "college" perspective, but much of it, at least in this first issue, is depressingly familiar. (SL)
