

SPECTROSCOPIC AND KINETIC STUDIES OF ATMOSPHERIC FREE RADICALS

ELIZABETH FOREMAN, YITIEN JOU, KARA KAPNAS, *Chemistry, University of California, Irvine, Irvine, CA, USA*; CRAIG MURRAY, *Department of Chemistry, The University of California, Irvine, CA, USA*.

Photo-induced radical chemistry is crucial to atmospheric processes, namely: oxidation, particulate matter formation, and climate change. The combination of transient absorption and pulsed cavity ring-down spectroscopies is used to study weak electronic or overtone transitions of trace gas-phase species and investigate the kinetic and photochemical properties of important transient atmospheric radicals.
