FORMATION OF COMPLEXES c-C₃H₆...MCl (M = Ag or Cu) AND THEIR CHARACTERIZATION BY BROAD-BAND ROTATIONAL SPECTROSCOPY

DANIEL P. ZALESKI, JOHN CONNOR MULLANEY, NICK WALKER, School of Chemistry, Newcastle University, Newcastle-upon-Tyne, United Kingdom; ANTHONY LEGON, School of Chemistry, University of Bristol, Bristol, United Kingdom.

New molecules formed by the non-covalent interaction of cyclopropane (c-C₃H₆) with MCl, where M is either Ag or Cu, have been detected and characterized by means of broadband rotational spectroscopy. They were synthesized by laser ablation of a silver or copper rod in the presence of a gaseous sample containing 1% each of c-C₃H₆ and CCl₄, with the remainder argon. Spectra of several isotopologues of each complex have been analysed. The title molecules are found to have C₄ᵥ symmetry, and the geometry can be described by the MCl subspecies coordinating “edge on” to the cyclopropane ring. Experimental structures will be compared with those from ab initio calculations and those of related species.
