

## **3D models for interior spaces**

**By: Joe Burritt  
Business**

**My image shows how depth sensors view on the left and create on the right 3D models for the Virtual Reality and Augmented Reality startup I've built with colleagues. We have reimagined how to view interior spaces by utilizing computer vision technology and depth sensors to enable anyone to create a 3D model of their home or office using their smartphone. These 3D models can then be edited by swapping in/out furniture, flooring, appliances, or paint colors in real time which allows users to instantly see what their home or office could look like with new products. Users create, edit, and share 3D models with friends using our mobile app. This is the future of interior design and real estate.**
