

Ultrafast Vibronic Dynamics of Functional Organic Polymer Materials: Coherence, Confinement, and Disorder

I. Burghardt

Institute for Physical and Theoretical Chemistry, Goethe University Frankfurt, Germany

73rd International Symposium on Molecular Spectroscopy
University of Illinois at Urbana-Champaign
June 18-22, 2018

Topics

- 1 Photoinduced Energy & Charge Transfer in Functional Organic Materials
Goal: First-Principles Approach to Organic Photovoltaics
Electron-Hole Lattice Models & Electron-Phonon Coupling
Quantum Dynamics in Many Dimensions

OPV: Not Yet Competitive ... But Making Progress!

Best Research-Cell Efficiencies

<http://www.nrel.gov/ncpv/> (National Center for Photovoltaics)

How to Optimize Devices: Synthesis/Spectroscopy/Theory

A speedier way to evaluate organic photovoltaics, Akinori Saeki, SPIE Newsroom. DOI: 10.1117/2.1201111.003967

- **synthetic chemistry:** optimized donor-acceptor combinations
- **spectroscopy:** optical spectroscopy, time-resolved microwave conductivity, terahertz time-domain spectroscopy, electroabsorption spectroscopy, ...
- **theoretical chemistry:** electronic structure + quantum dynamics

Elementary Processes of Organic Photovoltaics

Kim et al., Nature Materials, 5, 197 (2006)

elementary steps:

- creation of electron-hole pairs (**excitons**)
- exciton dissociation at donor-acceptor junctions (here, PCBM-P3HT)¹
- capture of charge carriers at electrodes
- potentially competing process: electron-hole recombination

¹PCBM = phenyl-C₆₁-butyric acid methyl ester, P3HT = poly(3-hexylthiophene)

Zeroth-Order Picture of Donor/Acceptor Heterojunction

polymer/polymer interface:

- HOMO/LUMO \leftrightarrow valence/conduction band
- 1st bound excited state: singlet exciton ($^1B_u^-$ in PPV); Frenkel type exciton
- @junction: compare band offset vs. exciton binding energy ($\epsilon_B \sim 0.5$ eV)

Exciton Dissociation at Bulk Heterojunctions (BHJ's)

AFM image of d-F8:F8BT blend

McNeill & Greenham, Adv. Mater. 21, 1 (2009)

Schematic of exciton dissociation

Peumans, Uchida, Forrest, Nature **125**, 8098 (2003)

- **bulk heterojunction** technology led to breakthrough in ~ 1995
- maximization of interface area \longrightarrow increase likelihood that excitons encounter interface within diffusion length ~ 10 nm

What is the Best Nano-Morphology?

Highly ordered nanostructured domains (typically sub-10 nm) are thought to

- facilitate exciton diffusion
- favor exciton dissociation
- facilitate free carrier transport

Nanostructured domains can be achieved by

- self-assembly properties of D/A oligomers
- thin film processing methods (e.g., nanoimprint lithography)

However, the role of nanoscale ordering is controversial:

Guo et al., JACS 136, 10024 (2014)

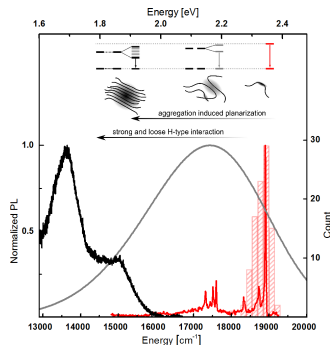

- e.g., in a recent study of DA copolymer:fullerene systems, it is shown that the charge separation energetics changes **unfavorably** upon formation of crystalline domains

Insights from Spectroscopy

absorption spectrum: regioregular P3HT
with admixtures from regiorandom P3HT

Vohra et al., Appl. Phys. Lett. (2012)

Raithel et al., Macromolecules 49, 9553 (2016)

- P3HT: inhomogeneous broadening across 200 nm
- huge red shift between solution and bulk: ordered low-energy conformations
- signatures of vibronic structure due to high-frequency modes ($\sim 1500 \text{ cm}^{-1}$)
- single-molecule spectroscopy unravels signals from single chromophores

Thiessen, Vogelsang, Adachi, Steiner, Vanden Bout, Lupton, PNAS E3550 (2013)

Time-Resolved Spectroscopies

Collini, Scholes, Science 323, 369 (2009)

- 2D electronic spectroscopy monitors ultrafast energy and charge transfer
- time-resolved Raman spectroscopy provides signatures of ultrafast structural dynamics

Anna, Song, Dinshaw, Scholes, Pure. Appl. Chem. 85, 1307 (2013)

De Sio, Lienau, PCCP 19, 18813 (2017)

Zhou, Yu, Bragg, J. Phys. Chem. Lett. 6, 3496 (2015)

Which Theoretical Methods, Even for a Minimal Model?

- tens to hundreds of electronic states
- aggregate-type systems
- charge transfer and excitonic couplings^(*) required
- delocalized excitations
- strong electron-phonon coupling
- non-Markovian dynamics
- non-exponential transfer
- coherent wavepacket dynamics
- standard rate theories (Förster / Marcus) not necessarily valid

<http://phys.org/news/2014-02-result-cheaper-efficient-solar-cells.html>

^(*)excitonic coupling = transition density interaction:

$$V_{DA} = \frac{1}{4\pi\epsilon_0} \int d\mathbf{r}_D d\mathbf{r}_A \frac{\rho_D^{(eg)}(\mathbf{r}_D) \rho_A^{(ge)}(\mathbf{r}_A)}{|\mathbf{r}_D - \mathbf{r}_A|} \longrightarrow \text{limiting case: transition dipole interaction}$$

Two Types of Approaches

approximate electron-nuclear dynamics:
e.g., time-dep. Kohn-Sham equation

$$i\frac{\partial}{\partial t}\phi_i(r,t) = \left(-\frac{\nabla^2}{2} + v_{\text{KS}}(r,t)\right)\phi_i(r,t)$$

expand in adiabatic KS basis,
 $\phi_i(r,t) = \sum_k c_{ik}(t)\tilde{\phi}_k(r;R)$ such that

$$i\frac{dc_{ik}}{dt} = \sum_l c_{il}(t)(\epsilon_l\delta_{kl} + d_{kl}\cdot\dot{R})$$

Ehrenfest or Surface Hopping dynamics

e.g., Craig, Duncan, Prezhd, PRL 95, 163001 (2005)

pro's: no pre-computed potentials
con's: possibly poor description of excited states and nuclear dynamics

parametrized model Hamiltonian
+ multi-state quantum nuclear dynamics

$$i\frac{\partial}{\partial t}\psi(R,t) = \hat{H}\psi(R,t)$$

with a multi-state/site Hamiltonian

$$\hat{H} = \sum_{mn}(\hat{h}_{mn}^e + \hat{h}_{mn}^{e-ph}(R))|m\rangle\langle n| + \hat{H}_0^{ph}(R)$$

and $|\psi(R,t)\rangle = \sum_n c_n(t)\Phi_n(R,t)|n\rangle$

use (approximate) quantum dynamics

e.g., Kondov et al., JPCC 111 (2007), Tamura et al., JACS 135 (2013)

pro's: immediate physical interpretation
con's: restricted number of coordinates, electronic couplings *via* diabaticization

Road Map: Model Hamiltonians & Quantum Dynamics

e-h lattice models + non-perturbative *e-ph* interaction + quantum dynamics

- electron-hole (*e-h*) lattice models including vibronic interactions
- *ab initio* (typically CC2, ADC(2)) and/or TD-DFT parametrization
- **diabatization** procedures to generate electronic couplings
- compute **spectral densities** and effective-mode decomposition
- efficient high-dimensional **nonadiabatic quantum dynamics** using multi-configurational methods (MCTDH) or reduced dynamics (HEOM) + semiclassical/quantum-classical approaches (SQC/MM, Ehrenfest)
- “molecular aggregate” perspective: parametrization for small fragments & dynamics for larger systems Polkehn, Eisenbrandt, Tamura, Burghardt, Int. J. Quant. Chem. 118:e25502 (2018)

CC2 = Second-Order Approximate Coupled-Cluster

ADC(2) = Second-Order Algebraic-Diagrammatic Construction (ADC(2)) scheme

MCTDH = Multi-Configuration Time-Dependent Hartree Beck et al., Phys. Rep. **324**, 1 (2000)

HEOM = Hierarchy of Equations of Motion Tanimura, J. Phys. Soc. Jpn. **75**, 082001 (2006)

Electron-Hole Lattice Model

$$|1_e\rangle_C \otimes |1_h\rangle_V$$

$$|1_e\rangle_C \otimes |2_h\rangle_V$$

$$|1_e\rangle_C \otimes |3_h\rangle_V$$

- electron-hole (e - h) configurations:

$$|\mathbf{n}\rangle = |n_e n'_h\rangle = |n_e\rangle_C \otimes |n'_h\rangle_V$$

- Hamiltonian in this basis:

$$\hat{H} = \sum_{\mathbf{mn}} (\hat{h}_{\mathbf{mn}}^{eh} + \hat{h}_{\mathbf{mn}}^{eh-ph}(\mathbf{x})) |\mathbf{m}\rangle \langle \mathbf{n}| + \hat{H}_0^{ph}(\mathbf{x})$$

Merrifield, J. Chem. Phys. 34, 1835 (1961)

Wang and Mukamel, Chem. Phys. Lett. 192, 417 (1992)

Karabunarliev and Bittner, J. Chem. Phys. 118, 4291 (2003)

Binder, Wahl, Römer, Burghardt, Faraday Discuss, 163, 205 (2013)

- includes **Frenkel-type exciton (XT)** states and **charge transfer (CT)** states
- oligomer (fragment) *ab initio* or TDDFT calc's: on-site energies, diabatic couplings
- vibronic couplings from Franck-Condon gradients, geometry optimization, PES cuts

Special Case: Frenkel Exciton Model

- Frenkel model ($n_e = n'_h = n$) often a good approximation to describe exciton
- exact analytic mapping of oligomer PES's to Frenkel model

Binder, Römer, Wahl, Burghardt, J. Chem. Phys. 141, 014101 (2014)

stacked oligothiophene (OT4)₂: "HJ aggregate"

- delocalized states

$$|\Psi_{\text{exciton}}\rangle = \sum_n^{N_{\text{exc}}} c_n |n\rangle$$

where $N_{\text{exc}} \sim 5-10$; $|n\rangle$ = configuration with single excitation on n th monomer

- trapping due to exciton-phonon interactions

- **J-aggregate**: end-to-end alignment of monomer units; lowest state of the exciton manifold is the bright state
- **H-aggregate**: plane-to-plane stacked geometry; highest state of the exciton manifold is the bright state
- **HJ-aggregate**: combination of both, as in stacked oligomers

Yamagata, Spano, JCP **136**, 184901 (2012)

HJ-Aggregate: Vibronic Lattice Model

Binder, Römer, Wahl, Burghardt, J. Chem. Phys. 141, 014101 (2014)

Binder, Polkehn, Ma, Burghardt, Chem. Phys. 482, 16 (2017)

- here: analytic mapping of oligomer PES onto Hückel type model in 1D or 2D: solution to an inverse eigenvalue problem

(NB.: V_G/V_E : monomer potentials, w : site-to-site coupling)

System-Bath Models

S region: e.g., electronic degrees of freedom (electron-hole states)

B region: all vibrations (phonons) mapped to harmonic oscillator model

$$\hat{H}_B + \hat{H}_{SB} = \sum_n \frac{1}{2} (\hat{p}_n^2 + \frac{1}{2} \omega_n^2 \hat{x}_n^2) + \hat{s} \sum_n c_n \hat{x}_n$$

$$J(\omega) = \pi/2 \sum_n c_n^2 / \omega_n \delta(\omega - \omega_n)$$

spectral density

Spectral Densities from Electronic Structure Calculations^(*)

$$J(\omega) = \frac{\pi}{2} \sum_n^N \frac{c_n^2}{\omega_n} \delta(\omega - \omega_n) \simeq \frac{\pi}{2} \sum_n^N \frac{c_n^2}{\pi} \frac{\Delta}{(\omega - \omega_n)^2 + \Delta^2}$$

Tamura, Martinazzo, Ruckebauer, Burghardt, J. Chem. Phys., 137, 22A540 (2012)

^(*)NB. Alternatively: obtain SD's from correlation functions (MD, CPMD, ...)

Unitary Propagation vs. Master Equations

- ① explicit, multidimensional dynamics for the full system + bath space:
wavefunction $\psi_{SB}(t)$ or density operator $\hat{\rho}_{SB}(t) = \sum_n p_n |\psi_{n,SB}(t)\rangle \langle \psi_{n,SB}(t)|$

→ typically (ML-)MCTDH

Meyer, Manthe, Cederbaum, Chem. Phys. Lett. **165**, 73 (1990), Beck et al., Phys. Rep. **324**, 1 (2000)

- ② non-Markovian master equations: $\hat{\rho}_S(t) = \text{Tr}_B \hat{\rho}_{SB}(t)$

→ typically Hierarchy of Equations of Motion (HEOM)

Tanimura, J. Phys. Soc. Jpn. **75**, 082001 (2006)

- ③ intermediate methods: explicit treatment of subsystem + effective-mode (E) part of the bath + Markovian master equation for residual (B') bath:²

$$\frac{\partial \hat{\rho}_{SE}}{\partial t} = -\frac{i}{\hbar} [\hat{H}_{SE}, \hat{\rho}_{SE}(t)] + \hat{L}_{\text{diss}}^{(B')} \hat{\rho}_{SE}(t) \quad ; \quad \hat{\rho}_{SE}(t) = \text{Tr}_{B'} \hat{\rho}_{SEB'}(t)$$

²e.g., Caldeira-Leggett: $\hat{L}_{\text{diss}}^{(B')} \hat{\rho}_{SE} = -i \frac{\gamma}{\hbar} [\hat{X}_E, [\hat{P}_E, \hat{\rho}_{SE}]_+] - \frac{2\gamma M k T}{\hbar^2} [\hat{X}_E, [\hat{X}_E, \hat{\rho}_{SE}]]$

Unitary System + Bath Dynamics: MCTDH

$$\Psi(r,t) = \sum_J A_J(t) \Phi_J(r,t) \equiv \sum_{j_1=1}^{n_1} \cdots \sum_{j_N=1}^{n_N} A_{j_1 \dots j_N}(t) \prod_{\kappa=1}^N \phi_{j_\kappa}^{(\kappa)}(r_\kappa, t)$$

- **Multi-Configuration Time-Dependent Hartree**: tensor approximation scheme
Meyer, Manthe, Cederbaum, Chem. Phys. Lett. **165**, 73 (1990), Beck et al., Phys. Rep. **324**, 1 (2000)
- EoM's from the Dirac-Frenkel variational principle: $\langle \delta \Psi | \hat{H} - i \frac{\partial}{\partial t} | \Psi \rangle = 0$
- MCTDH takes one to **50-100 modes**; exponential scaling alleviated
- restriction on the form of the potential: sums over products
- related multi-layer variant (**ML-MCTDH**) goes up to **1000 modes**
Wang, Thoss, J. Chem. Phys. **119**, 1289 (2003), Manthe, J. Chem. Phys. **128**, 164116 (2008), Vendrell, Meyer, *ibid* **134**, 044135 (2011)
- related **MCTDH-F** (fermion) and **MCTDH-B** (boson) methods
Kato, Kono, Chem. Phys. Lett. **392**, 533 (2004), Nest, Klamroth, Saalfrank, J. Chem. Phys. **122**, 124102 (2005)
Alon, Streltsov, Cederbaum, Phys. Lett. A **362**, 453 (2007)
- **density matrix** variant
Raab, Burghardt, Meyer, J. Chem. Phys. **111**, 8759 (1999)
- **hybrid** approaches: e.g., Gaussian-based variant (**G-MCTDH**, **vMCG**)
Burghardt, Meyer, Cederbaum, J. Chem. Phys. **111**, 2927 (1999), Worth, Burghardt, Chem. Phys. Lett. **368**, 502 (2003)

Multi-Layer(ML)-MCTDH: Hierarchical Tensor Form

$$\Psi(r, t) = \sum_J A_J(t) \Phi_J(r, t) = \sum_J A_J(t) \prod_{\kappa=1}^M \varphi_{j_{\kappa}}^{(\kappa)}(r_{\kappa}, t)$$

where the **1st-layer SPFs** $\varphi_{j_{\kappa}}^{(\kappa)}$ are now built as superpositions of **2nd-layer SPFs**,

$$\varphi_{j_{\kappa}}^{(\kappa)}(r_{\kappa}, t) = \sum_L B_{j,L}^{(\kappa)}(t) \Phi_L^{(\kappa)}(r_{\kappa}, t) = \sum_L B_{j,L}^{(\kappa)}(t) \prod_{\mu} \varphi_{l_{\mu}}^{(\kappa, \mu)}(r_{\kappa\mu}, t)$$

... and so on ...

- intra-SPF correlations *via* MCTDH form
- continue to higher orders: ML-MCTDH
- “hierarchical Tucker format”
- recent Gaussian-based variant

Römer, Ruckebauer, Burghardt, J. Chem. Phys. 138, 064106 (2013)

Wang, Thoss, J. Chem. Phys. 119, 1289 (2003), Manthe, J. Chem. Phys. 128, 164116 (2008), Vendrell, Meyer, J. Chem. Phys. 134, 044135 (2011)

Quantum Coherence Plays a Non-Negligible Role!

$$|\psi(t)\rangle = c_0(t)|0\rangle|\phi_0(t)\rangle + c_1(t)|1\rangle|\phi_1(t)\rangle$$

electronic coherence:

$$\begin{aligned}\rho_{01}(t) &= \text{Tr}[|0\rangle\langle 1|\hat{\rho}(t)] \\ &= \langle 1|\hat{\rho}(t)|0\rangle = c_1^*(t)c_0(t)\langle\phi_1(t)|\phi_0(t)\rangle\end{aligned}$$

- coherence \propto **overlap of nuclear wavefunctions**
- typical decoherence times: tens to hundreds of fs or more (estimate from $\tau_{\text{dec}} \sim \tau_g(6k_B T/\lambda)^{1/2}$ or $\tau_{\text{dec}} \sim \gamma^{-1}(\lambda_T/\Delta x)^2$)

Prezdho, Rossky, PRL 81, 5294 (1998)

- loss of coherence not captured by classical trajectory picture

picture: P. Rossky et al.

Topics

Summary & Outlook

Oligothiophene-Fullerene Junctions

(collaboration with Hiroyuki Tamura (Sendai), Keith Hughes (Bangor), Rocco Martinazzo (Milano))

Tamura, Burghardt, Tsukada, JPCC, 115, 10205 (2011)

- model for polymer-fullerene heterojunctions, e.g., P3HT-PCBM ¹
- ultrafast initial charge transfer (~ 50 fs [Brabec et al., CPL (2001)])
- but subsequent generation of free charge carriers not necessarily ultrafast

¹PCBM = phenyl-C₆₁-butyric acid methyl ester, P3HT = poly(3-hexylthiophene)

Oligothiophene-Fullerene Junction: Dimer Model

diabatic coupling:
 distance dependence

- LC-TDDFT calculations (LC = long-range corrected)
- diabaticization scheme using reference functions of pure XT vs. CT character
- normal mode analysis for separate C₆₀⁻ and OT₄⁺ fragments (264 modes)

Tamura, Burghardt, Tsukada, J. Phys. Chem. C, 115, 10205 (2011)

Two-State XT-CT Charge Transfer Model

$$\hat{H} = \hat{H}_0 + \hat{H}_R + \hat{H}_B$$

\hat{H}_0 : electronic part

\hat{H}_R : inter-fragment coordinate part

\hat{H}_B : phonon bath part

$$\hat{H}_0 = \Delta_{\text{XT-CT}} |\text{CT}\rangle \langle \text{CT}| + \gamma (|\text{XT}\rangle \langle \text{CT}| + |\text{CT}\rangle \langle \text{XT}|)$$

$$\begin{aligned} \hat{H}_R = & \frac{\omega_R}{2} (\hat{R}^2 + \hat{P}^2) + \kappa_R \hat{R} |\text{CT}\rangle \langle \text{CT}| \\ & + \gamma_R \hat{R} (|\text{XT}\rangle \langle \text{CT}| + |\text{CT}\rangle \langle \text{XT}|) \end{aligned}$$

$$\hat{H}_B = \sum_{i=1}^N \frac{\omega_i}{2} (\hat{x}_i^2 + \hat{p}_i^2) + \sum_{i=1}^N \kappa_i x_i |\text{CT}\rangle \langle \text{CT}| + \sum_{i=1}^N \frac{\kappa_i^2}{2\omega_i}$$

Tamura, Martinazzo, Ruckebauer, Burghardt, J. Chem. Phys., 137, 22A540 (2012)

Ultrafast Coherent Transfer Dynamics

el. coherence: $\rho_{XT,CT}(t) = \text{Tr}\{ |CT\rangle \langle XT| \hat{\rho}(t) \}$

- imaginary part $(-2\gamma/\hbar)\text{Im}\rho_{XT,CT} \leftrightarrow$ population flux
- real part \leftrightarrow stationary coherent superposition ($P_{XT} \sim 0.1$, $P_{CT} \sim 0.9$)
- **experiment:** ultrafast ET (~ 50 fs), oscillatory features [Brabec et al., CPL (2001)] confirmed by recent pump-probe experiments by Lienau group [Science (2014)]

Temperature Dependence Not a Key Factor

- Hierarchical Equations of Motion (HEOM) approach Tanimura, J. Phys. Soc. Jpn. **75**, 082001 (2006)
- reduced dynamics + effective mode decomposition Burghardt et al., JCP **137**, 144107 (2012)
- experiments show negligible temperature dependence Pensack, Asbury, JACS **131**, 15986 (2009)

Hughes, Cahier, Martinazzo, Burghardt, Chem. Phys., **442C**, 111 (2014)

Marcus Theory Doesn't Work for Ultrafast Charge Transfer

Unger et al., J. Phys. Chem. C 121, 22739 (2017)

- Marcus (M) & Marcus-Levich-Jortner (MLJ) rates:

$$k_M = \frac{|V|^2}{\hbar} \sqrt{\frac{\pi}{\lambda k_B T}} \exp \left[-\frac{(\lambda + \Delta G_0)^2}{4\lambda k_B T} \right] ; \quad k_{MLJ} = \frac{|V|^2}{\hbar} \sqrt{\frac{\pi}{\lambda_0 k_B T}} \sum_{v=0}^{\infty} \frac{e^{-S} S^v}{v!} \exp \left[-\frac{(\lambda + \Delta G_0)^2}{4\lambda k_B T} \right]$$

Free Carrier Generation

(collaboration with Hiroyuki Tamura (WPI-AIMR Tohoku University))

Tamura, Burghardt, JPCC, 117, 15020 (2013)

- Coulomb barrier to free carrier generation
- validity of Onsager-Braun rate model for CT break-up to be questioned
- “hot CT” hypothesis: efficient charge separation due to excess energy
- time scale of free carrier generation controversial & system-dependent (fs- μs)

Free Carrier Generation, Cont'd

Tamura, Burghardt, JACS (Communication) 135, 16364 (2013)

Huix-Rotllant, Tamura, Burghardt, J. Phys. Chem. Lett., 6, 1702 (2015)

factors favoring ultrafast $e-h$ separation:

- electron delocalization over fullerene aggregates: **strong decrease of barrier**
- hole delocalization on oligothiophenes
- XT delocalization in H-aggregate donor
- exciton (XT) excess energy: **"Hot CT"** mechanism

Delocalized XT States Partially Circumvent Interfacial Traps

$$\hat{H} = \hat{H}_{\text{XT}_1-\text{CT}}(\mathbf{x}) + \sum_n \hat{H}_{\text{CS}}^{(n)}(\mathbf{x}) |\text{CS}_n\rangle \langle \text{CS}_n| + t(\mathbf{x}) (|\text{CS}_1\rangle \langle \text{CT}| + \sum_{nn'} |\text{CS}_n\rangle \langle \text{CS}_{n'}| + h.c.) \\ + \sum \hat{H}_{\text{XT}}^{(n)}(\mathbf{x}) |\text{XT}_n\rangle \langle \text{XT}_n| + j(\mathbf{x}) \sum (|\text{XT}_n\rangle \langle \text{XT}_{n'}| + h.c.)$$

- CT/CS generation depends on exciton (de)localization
- ML-MCTDH calculations: 26 states/120 modes (barrier II)

Electronic Eigenstate Picture

- interplay of delocalization, internal conversion, and charge transfer
- de/localized initial condition (blue/red) reduces/enhances interfacial trapping

Huix-Rotllant, Tamura, Burghardt, J. Phys. Chem. Lett., 6, 1702 (2015)

“Quantum Coherence Controls the Charge Separation in a Prototypical Organic Photovoltaic System”

Lienau and collaborators (Science, 2014)

- **coherent dynamics** on femtosecond/picosecond time scale
 - **spatial coherence**: delocalization of both excitons and carriers
 - **delocalization** modifies energetics *and* dynamics
 - **static** and **dynamic** disorder
 - **localization** *via* internal conversion towards interfacial trap
 - **delocalization** *via* vibronically hot states
-
- coherent vibronic effects and fluctuations far away from equilibrium
 - **very different picture from Marcus theory!**

collaboration with S. Haacke, S. Méry (Strasbourg)

Wenzel, Dreuw, Burghardt, PCCP, 15, 11704 (2013)

- competing ultrafast energy transfer (EET) and charge transfer (CT) processes
- in chloroform: EET in 130 fs, followed by CT in 2.7 ps
- in liquid crystalline phase: CT in 60 fs!
- relatively fast recombination (50 ps) – material doesn't really work well ...

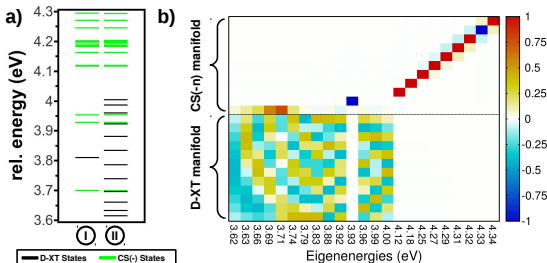

What is Happening in the First-Generation Material?

Polkehn et al., J. Phys. Chem. Lett., 7, 1327 (2016)

- first-generation material: liquid crystalline smectic mesophase
- idea: D/A stacks serve as “quantum wells” for carrier transport
- much faster charge transfer in film than solution (~ 50 fs vs. ~ 3 ps)
- calculations suggest unexpected inter-chain D-A interactions

Liquid Crystalline Phase – Energetics

- energetics at Franck-Condon geometry
- state mixing: excitonic manifold and CS(-1) state
- but higher charge separated states barely accessible

- on-site energies computed from ADC(2) and TDDFT
- internal field: 20 V/ μm
- CS(-1) state strongly stabilized

Polkehn, Tamura, Eisenbrandt, Haacke, Méry, Burghardt, J. Phys. Chem. Lett., 7, 1327 (2016)

Liquid Crystalline Phase – Dynamics

Polkehn et al., JPCL (2016)

Roland et al., PCCP (2012)

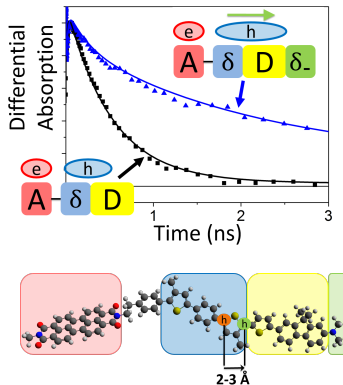

- transition to CS(-1) states (~ 50 fs) explains transient absorption experiments (Haacke)

- ML-MCTDH simulations for 156 states/48 modes

Second Generation Material: Zipper-like Molecular Packing

Biniak et al., J. Mater. Chem. C 3, 3342 (2015)

Liu, Eisenbrandt et al., PCCP 18, 18536 (2016)

- tunable donor species: alternating thiophene/fluorene/benzothiadiazole units; electrodeficient bridge to the perylene acceptor – **chemical design!**
- organization in lamellae (both DA and ADA – but not DAD)
- comparatively slow CT formation (tens of ps) - **and less recombination**

Second Generation Material: In Progress ...

- coarse-grained model for Kinetic Monte Carlo (KMC) simulations
- microelectrostatics calculations (collaboration with G. d'Avino, Grenoble)
- multi-scale modeling needed!

Summary & Outlook

Exciton Dynamics in Organic Semiconducting Polymers

Collini, Scholes, Science 323, 369 (2009)

- ~ 0.1 ps: coherent intra-chain excitation energy transfer (EET) dynamics
- ~ 0.1 ps: self-trapped exciton-polaron states
- ~ 0.1 -few ps: torsional geometry relaxation interfering with EET
- ~ 1 -10 ps: inter-chain EET
- \sim ps-ns: thermally assisted hopping

Exciton Migration Guided by Conformational Dynamics

- full quantum dynamical study for small oligomers (5-20 units)
- Oligothiophene (OT) and Oligo-Phenylenevinylene (OPV)
- ML-MCTDH (up to 50 states, 100 vibrational modes)
- monomer-based, *ab initio* parametrized Hamiltonian

Binder, Wahl, Römer, Burghardt,
Faraday Discuss 163, 205 (2013)
Panda, Plasser, Aquino, Burghardt, Lischka
J. Phys. Chem. A, 117, 2181 (2013)
Wahl, Binder, Burghardt
Comp. Theor. Chem. 1040, 167 (2014)

- Is the transfer dynamics on ultrafast time scales **coherent** or of hopping type?
- Is a trapped **exciton-polaron** generated and if so, on which time scale?
- Is the **spectroscopic unit** concept valid?

see also: Tretiak, Saxena, Martin, Bishop, Conformational Dynamics of Photoexcited Conjugated Molecules, Phys. Rev. Lett. 89, 097402 (2002)

Electronic Structure: Trapping in OPV Oligomers

Collaboration with H. Lischka, F. Plasser (Vienna/Texas Tech/Tianjin University)

LUMO (105b)

HOMO (106a)

- high-level electronic structure methods (ADC(2), CC2, MRCI)
- exciton trapping, due to BLA modes, described correctly

Panda, Plasser, Aquino, Burghardt, Lischka, JPCA, 117, 2181 (2013), see also: Sterpone, Rossky, JPCB 112, 4983 (2008), Nayyar et al., JPCL 2, 566 (2011)

Dynamics: Test Case OT-20

- Do we see trapped exciton-polarons in the dynamics?
- How exactly does the exciton migrate as the conjugation break “heals”?
- How does the spatial extension of the exciton change as a function of conformational (torsional) fluctuations?

Monomer representation:
most unbiased picture to answer
these questions!

Relevant Coordinates: Torsions, CC Stretch, Ring Modes

- analytical, pointwise mapping of oligomer PES's onto a Frenkel model
- diabaticization in terms of solution to an inverse eigenvalue problem
- applicable to “extended Hückel systems” of J / H / HJ-aggregate type

Ab initio Frenkel-Holstein Hamiltonian

$$\hat{H} = \sum_{n,n'=1}^N (\delta_{n,n'} \hat{T} + \delta_{n,n'} \hat{V}_n^{\text{site}} + \hat{V}_{n,n'}^{\text{exc}}) |n\rangle \langle n'| + \hat{H}_{\text{bath}} \hat{1}$$

- kinetic energy in curvilinear coordinates (using TNUM code):

$$\hat{T} = \frac{1}{2} \left(\sum_{n=1}^N G_{xx} \hat{p}_{x_n}^2 + \sum_{n=1}^{N-1} (G_{yy} \hat{p}_{y_{n,n+1}}^2 + G_{\theta\theta} \hat{p}_{\theta_{n,n+1}}^2) + 2 \sum_{n=1}^N G_{xy} \hat{p}_{x_n} (\hat{p}_{y_{n,n+1}} + \hat{p}_{y_{n,n-1}}) \right)$$

- site energies:

$$\hat{V}_n^{\text{site}}(\{\hat{x}, \hat{y}, \hat{\theta}\}) = \hat{V}_0(\{\hat{x}, \hat{y}, \hat{\theta}\}) + \hat{\Delta}_n(\hat{x}_n, \hat{y}_{n,n\pm 1}, \hat{\theta}_{n,n\pm 1})$$

with the difference potential

$$\hat{\Delta}_n(\hat{x}_n, \hat{y}_{n,n\pm 1}, \hat{\theta}_{n,n\pm 1}) = c_E + \hat{v}_E(\hat{x}_n, \hat{y}_{n,n\pm 1}, \hat{\theta}_{n,n\pm 1}) - \hat{v}_G(\hat{x}_n, \hat{y}_{n,n\pm 1}, \hat{\theta}_{n,n\pm 1})$$

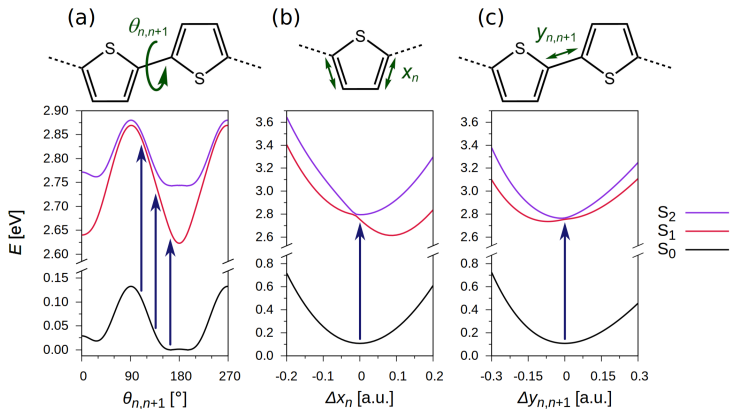

- excitonic coupling:

$$\hat{V}_{n,n\pm 1}^{\text{exc}}(\hat{\theta}_{n,n\pm 1}) = \hat{w}(\hat{\theta}_{n,n\pm 1}) \quad \leftarrow \text{large (of the order of 1 eV)}$$

reduces to standard Frenkel-Holstein model if

- the excitonic coupling is constant
- a single *site-local* mode per site is included
- the monomer potentials conform to shifted harmonic-oscillator potentials

Relevant Coordinates: Torsions, CC Stretch, Ring Modes

- high-dimensional PES as a function of site-local and site-correlated modes
- 20 monomer sites, 50 phonon modes

Quantum Dynamics: 20-Site J-Aggregate with Central Torsion

Binder, Lauvergnat, Burghardt, Phys. Rev. Lett. 120, 227401 (2018)

- ML-MCTDH calculations: 20 states, 50 modes (6-layer set-up)
- **earliest time scale**: exciton trapping (contraction by ~ 3 sites)
- high-frequency modes adapt to exciton: **quasi-stationary trapping**
- LEGS = local exciton ground state: nodeless left-localized exciton
Tozer, Barford, JPCA 116:10310 (2012)
- ultrafast decay of transition dipole autocorrelation function (~ 10 fs):
 $\langle \mu(0) | \mu(t) \rangle = |\mu|^2 \langle \psi_{\text{exc}}(0) | \psi_{\text{exc}}(t) \rangle$
- relates to anisotropy decay: ~ 40 fs

Grage et al., Phys. Rev. B, 67, 205207 (2003)

Quantum Dynamics: 20-Site J-Aggregate with Central Torsion

C-C inter-monomer mode + local C=C + torsion + bath

C-C inter-monomer mode + torsion + bath

Electronic Structure – Torsion Dependence

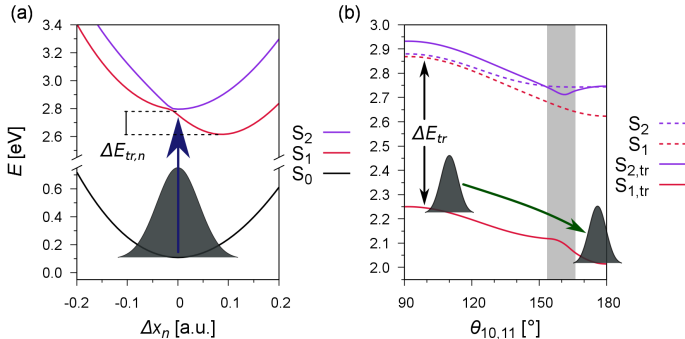

- transition density analysis

Panda, Plasser, Aquino, Burghardt, Lischka, JPCA (2013), Binder, Lauvergnat, Burghardt, Phys. Rev. Lett. 120, 227401 (2018)

- particle-in-the-box type e - h states
- marked dependence on torsion
- LEGS = **local exciton ground state**: nodeless S_1 exciton @ 180°

Tozer, Barford, JPCA 116:10310 (2012)

Exciton-Polaron Dynamics: Adiabatic Picture

- dynamics is essentially happening on coupled S_1/S_2 surfaces
- effective torsion potentials including stabilization due to trapping ($S_{1,tr}/S_{2,tr}$)¹
- torsional time scale (~ 400 fs) in agreement w. experiment Zhou et al., JPCL 6, 3496 (2015)
- energy loss due to external bath acting on torsional mode
- **exciton-polaron**: quasi-stationary trapping at all stages of the dynamics

¹i.e., “polaron transformed” potentials

Initial vs. Final States: Absorption Spectra

Tremel, Ludwigs, Adv. Polym. Sci. 265, 39 (2014)

- spectra calculated from Fourier transform of $C(t) = \langle \psi(0) | \psi(t) \rangle$:
 - (a) full 20-mer system: torsionally relaxed, stationary state
 - (b) left-localized 10-mer fragment for initial defect structure
 - (a) \longleftarrow (b): downhill energy transfer
- dominant vibronic signature of ring-breathing mode

Temperature Effects: Ehrenfest/Langevin dynamics

- single-trajectory simulation, with ZPE of high-frequency modes removed
- exciton migration at higher T is related to repeated non-adiabatic events
- interplay of torsional fluctuations and trapping explains observations
- quantum benchmark simulations needed (*via* random-phase wavefunctions, or thermofield method, combined with MCTDH)

Wahl, Hegger, Binder, Burghardt, in preparation

Polarons in π -Conjugated Polymers: Anderson or Landau?

William Barford,^{*,†} Max Marcus,^{†,‡} and Oliver Robert Tozer^{†,§}

"We show that the high-frequency C-C bond oscillation only causes Landau polarons for a very narrow parameter regime; generally we expect disorder to dominate and Anderson polarons to be a more applicable description."

J. Phys. Chem. A 120, 615 (2016)

Excitons in conjugated polymers: Do we need a paradigm change?

Wichard J. D. Beenken

"The fact that we could not find partition of excitons by structural defects – except of rare gauche defects and accidental chemical defects – leads us to the conclusion that we have to search for new mechanisms."

Phys. Status Solidi A 206, 2750 (2009)

Our interpretation: Exciton-polarons driven by defects and fluctuations

- exciton-polaron species: "exciton dressed by a cloud of local oscillators"
- typical delocalization length: 2-10 units (in line with experiment)
- Landau polaron (or Holstein "small" polaron) subject to disorder
- torsional defects confine excitons to sublattices ("spectroscopic units")
- hopping-type transition between exciton-polaron states induced by torsion
- elementary step is of "coherent hopping" type: highly correlated dynamics!

Charge Transfer Excitons in Neat Regioregular Polythiophene

experiment: Reid et al., Chem. Mater. 26, 561 (2014), De Sio et al., Nature Comm. 7, 13742 (2016)

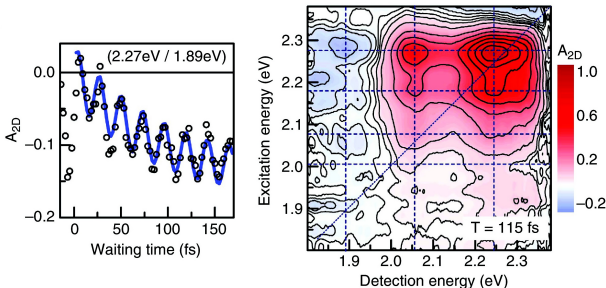

I: local adiabatic, II: full adiabatic

Popp, Polkehn, Tamura, Burghardt, to be submitted

- inter-chain CTX states favored in PT (as compared with, e.g., PPV)
- electronic structure (ADC(2), TDDFT): low-energy inter-chain CT states
- representative quantum dynamics calculations for $(OT)_n$, $n = 3, 5$
- diabaticization + Linear Vibronic Coupling (LVC) model
- ML-MCTDH for up to 13 electronic states, 196 modes

Charge Transfer Excitons in Neat Regioregular Polythiophene

2D electronic spectroscopy
P3HT (thin film)

De Sio et al., Nature Comm. 7, 13742 (2016)

- polaron cross-peak signal assigned to inter-chain CTX states
- sustained high-frequency oscillations (23 fs periodicity)
- simulated using 2-state/1-mode model
- similar observations by Scholes & collaborators
- What is the origin of the persistent oscillations?

Song et al., JCP 142, 212410 (2015)

Modified H-Aggregate: What's the Bright State?

Popp, Polkehn, Tamura, Burghardt, to be submitted

- (OT)₅ stack: significant mixing of XT and CT states
- bright state (S_5) looks distinctly different from typical H-aggregate (inverted curvature of nodeless exciton wavefunction) Hestand and Spano, J. Chem. Phys. 143, 244707 (2015)
- transition densities for H-type dimer *via* TheoDORÉ program (F. Plasser)
- very good agreement between ADC(2) and TDDFT/ ω B97XD results
- in line with benchmark study by Lischka & collaborators JCTC 10, 3280 (2014)

Spectral Densities (SD's)

- SD's calculated from state-specific Frank-Condon gradients
- SD's show large amplitude (\sim Huang-Rhys factor) for CC stretch modes
- SD's similar for various electronic states
- use SD's to parametrize Linear Vibronic Coupling (LVC) Hamiltonian
- ML-MCTDH: 13 states/196 modes (or 78 effective modes)

LVC Model – Full Quantum Dynamics (13 States, 196 modes)

$$\hat{H} = \hat{H}^{\text{on-site}} + \hat{H}^{\text{coup}} + \hat{H}^{\text{e-ph}}$$

$$\hat{H}^{\text{coup}} = j \sum_{n=1}^N |\text{XT}_n\rangle \langle \text{XT}_{n+1}| + \kappa_1 \sum_{n=1}^{N-1} |\text{XT}_n\rangle \langle \text{CTX}_{n+1,n}| + \kappa_2 \sum_{n=1}^{N-1} |\text{XT}_n\rangle \langle \text{CTX}_{n,n+1}| + h.c.$$

- two diabratization schemes Tamura, JPCA, 120, 9341 (2016), Blancafort, Voityuk, JCP 140, 095102 (2014)
- pronounced oscillatory signature in all state populations

Collective Vibronic Response

- high-frequency normal modes of OT fragments are evolving in phase
- amplification of vibronic effects due to exciton delocalization
- effective modes: linear combinations of dominant normal modes
- generalized effective-mode transformation (correlated XT/CTX modes)

Popp, Polkehn, Tamura, Burghardt, to be submitted

Do CTX States Affect Interfacial Charge Generation?

| | XT(1) | XT(2) | CTX(2,1) | CTX(1,2) | CS(1) | CS(2) |
|----------|-------|-------|----------|----------|-------|-------|
| XT(1) | 0.100 | 0.100 | 0.357 | 0.139 | 0.200 | 0.007 |
| XT(2) | | 0.100 | 0.139 | 0.357 | 0.014 | 0.013 |
| CTX(2,1) | | | 0.280 | 0.001 | 0.005 | 0.002 |
| CTX(1,2) | | | | 0.230 | 0.019 | 0.165 |
| CS(1) | | | | | 0.000 | 0.102 |
| CS(2) | | | | | | 0.140 |

Polkehn, Tamura, Burghardt, J. Phys. B, 51, 014003 (2018)

- CTX-to-CS transfer can circumvent interfacial XT-to-CS transfer step
- here: parameter determination via diabaticization by projection onto reference wavefunctions Tamura, JPCA 120, 9341 2016, Polkehn, Tamura, Burghardt, J. Phys. B, 51, 014003 (2018)

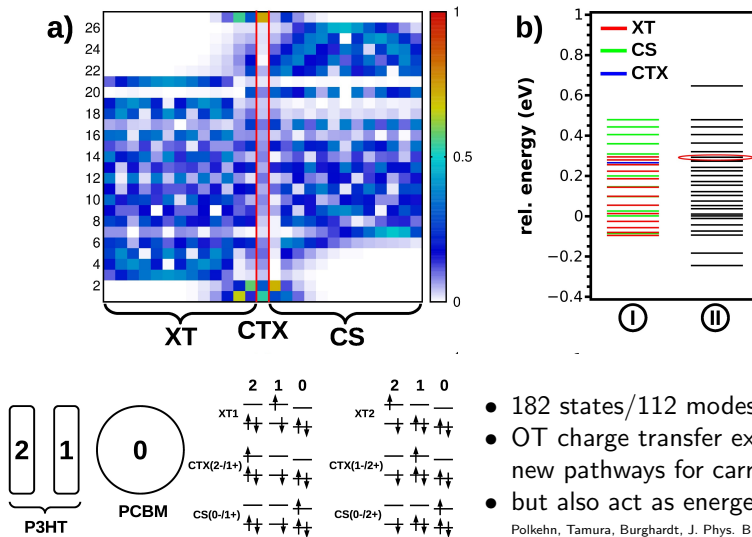

Interfacial Charge Separation in the Presence of CTX States

- CTX (turquoise) states emerge prominently as additional energetic traps
- ML-MCTDH calculations up to 182 states and 112 modes
- for a single CTX state: CS formation slightly reduced
- for larger models (50/182 states): reduction of CS yield is significant
- results depend in a sensitive fashion upon energetics and electronic couplings

Polkehn, Tamura, Burghardt, J. Phys. B, Special Issue "Light Energy Conversion, Light Harvesting", 51, 014003 (2018).

P3HT/PCBM Model Including CTX States

- 182 states/112 modes
- OT charge transfer excitons open new pathways for carrier formation
- but also act as energetic traps

Polkehn, Tamura, Burghardt, J. Phys. B, 51, 014003 (2018)

Summary

① Molecular-Level Approach to Organic Photovoltaics

- e - h lattice model: highlights fragment properties + molecular packing
- extensions to conical intersections, multi-exciton states¹ etc.
- accurate on-the-fly dynamics remains highly challenging

¹See our work on singlet fission: Tamura, Huix-Rotllant, Burghardt, Olivier, Beljonne, Phys. Rev. Lett. 115, 107401 (2015)

Summary

① Molecular-Level Approach to Organic Photovoltaics

- e - h lattice model: highlights fragment properties + molecular packing
- extensions to conical intersections, multi-exciton states¹ etc.
- accurate on-the-fly dynamics remains highly challenging

② Coherent Exciton Dynamics & Role of Nano-Morphology

- ultrafast (~ 50 - 100 fs) coherent initial charge separation
- Coulomb barrier to free carrier formation reduced in regioregular domains
- elementary exciton-polaron migration step is coherent

¹See our work on singlet fission: Tamura, Huix-Rotllant, Burghardt, Olivier, Beljonne, Phys. Rev. Lett. 115, 107401 (2015)
